

Level 2

Calculate the position and the direction of the rover after driving a certain distance with a certain steering angle.

$$\theta = \arccos(OP/PR)$$

Input: WheelBase Distance SteeringAngle
(3 floating point numbers)

coordinate=distance of x and distance from origin and perpendicular

9.53, 8.12, 0.00

Output: x y NewDirection

(3 floating point numbers, rounded to two digits)

x,y ... x,y position relative to starting position

NewDirection ... $0 \leq \text{NewDirection} < 360$

0,359

Example:

Input: 1.00 1.00 30.00

Output: 0.24 0.96 28.65

$$\text{TurnRadius} = \text{WheelBase} / \sin(\text{steeringAngles})$$
